

Project Title	Rising Waters: Machine Learning Based Flood Prediction System		
Developer	M. Thrishna Tanmayee	Team ID	[Team ID]
Date	26 June	Phase / Document	Requirement Analysis

4. Customer Journey Map

The journey map traces a single end-to-end interaction with Rising Waters, from first hearing about the tool through to acting on its recommendation. Mapping this out made it clear that the highest-friction points in a naive design would be the input step (a user without exact weather figures on hand would abandon the form) and the interpretation step (a bare probability score is not actionable on its own) — both of which were designed around directly in the final feature set.

CUSTOMER JOURNEY MAP

Stage	User Action	Thoughts / Emotion	Opportunity
Awareness	Learns about the Rising Waters tool	Curious, cautiously hopeful	Clear landing page explaining purpose
Access	Opens the web application	Expects a simple interface	Fast-loading, responsive UI
Input	Enters weather parameters, or uses Auto Fill	Wants minimal effort	Auto-Fill demo data generator
Prediction	Clicks "Analyze Flood Risk"	Anticipation	Instant response (<2s) from Flask backend
Interpretation	Views probability, severity tag, and insights	Reassured or alerted	Human-readable dynamic insights, not just a number
Action	Reviews recommended safety protocols	Empowered to act	Severity-tiered, actionable protocol list

Notably, the Access and Input stages carry the greatest risk of user drop-off in a real deployment, since a slow-loading page or a demanding data-entry form would undo the value of an otherwise accurate model. This is reflected in the emphasis placed on a lightweight, dependency-free frontend and the one-click Auto-Fill shortcut, both aimed at getting a first-time user to a result as quickly as possible.
